Mortality Protection Gap Study 2021 Synopsis

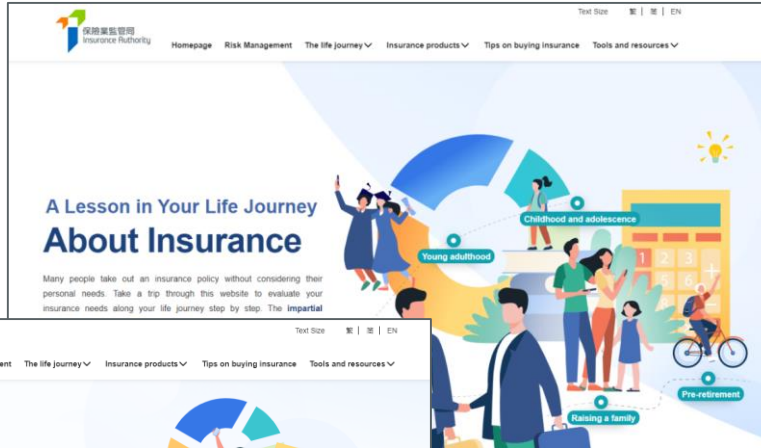

Average size of protection gap
HKD 1.9 million
* per economically active adult

▶ The fundamental purpose of life insurance is to protect policyholders against mortality risk (premature death of the breadwinner) which could make households very vulnerable to financial hardship, so it is worth attention.

▶ In this report, Mortality Protection Gap ("MPG") in Hong Kong is examined. MPG refers to the difference between the actual protection needs and financial resources available. The larger the mortality protection gap, the more dependent(s) would be unable to maintain the same living standard using the financial resources on hand.

Average size of protection gap
5.7 times
of annual income
* weighted average per economically active adult
